

## Galaga Setup Instructions

1. Download the game and save the zipped file in a place where you can easily find it again.
2. In java, create a new java project (the title doesn't matter).
3. Find the file you saved earlier, right click on it and select "Extract All..."
4. Choose a location where you can easily find the extracted files.
5. Select all the contents of the folder you just extracted to, and copy and paste them into the java project you created.
6. Run the project.

## How to Play

Basic: The ships at the left side of the screen represent the number of lives that you have remaining. To move your ship left and right, use the a and d keys, respectively. Your goal is to destroy all of the alien ships, who are trying to destroy you. To fire, press the spacebar. The red ships take one hit to kill, yellow ships take two, and the purple ones take three. Your goal is to kill all of the enemies before they kill you three times. If you kill all of the enemies on screen, you will progress to the next level. Every five levels, you get a bonus life, but the levels will get progressively harder.

Double ships: Sometimes, one of the purple ships will descend slowly, and deploy its tractor beam. If you fly into this beam, the ship will capture you, and turn green. Because you just lost a ship, you will lose a life (or it will be game over if you have no remaining lives). However, if you manage to kill the ship that captured you, your ship will be doubled, such that you can now fire two bullets at once. If one of these ships is hit, it will be destroyed and leave the other.
